

Accelerate movement of your large files into and out of cloud storage

Signiant Flight is an easy-to-deploy solution that accelerates the movement of large data sets into and out of cloud storage. Flight is built on Signiant's patented technology, which is known, trusted, and deployed extensively in corporations throughout the world.

- **FAST UPLOAD TO CLOUD STORAGE:** With Flight, you can now consider cloud storage for all kinds of time-sensitive use cases. Our patented acceleration technology uploads large files up to 200x faster than a standard transfer, providing immediate access to mission-critical data. With latency out of the picture, you can enjoy the benefits of cloud storage in a much broader range of applications.
- **EASY TO DEPLOY AND USE:** Flight lets you start moving data to the cloud within minutes. Download a client, connect to your cloud storage tenancy and start uploading — it's that simple! Flight is a unique SaaS solution that removes the operational burden of deploying and maintaining software in the cloud. We handle that for you, and it's all included in your subscription price.
- **AUTOMATIC SCALABILITY:** Flight provides automatic scaling and load balancing as your cloud payloads ebb and flow. Acceleration technology requires software and compute resources adjacent to the cloud storage, and we handle that for you. Even for a huge bulk upload project from a new location anywhere in the world, there's never a need for your team to spin up new servers — Flight scales up automatically to meet the demand.
- **INTEGRATION FLEXIBILITY:** To use Flight, you install client software in your on-premises infrastructure. A wide range of client options makes it easy to accelerate upload into both existing and new cloud-based workflows. Flight is available for use with the Command Line Interface (CLI). If you're an existing Signiant Manager+Agents customer, you can use the Signiant Flight M+A Component to integrate into your Manager+Agents workflow.
- **MULTIPLE CLOUD PLATFORMS:** Flight was built to be flexible, and that includes your choice of public cloud provider. Signiant offers the complete SaaS solution for Amazon S3 and Microsoft Azure, with Google Cloud support coming soon. You're free to commit to a single platform, mix and match for different applications, or make a change at any time. Your subscription covers them all.

ABOUT SIGNIANT

Signiant's intelligent file movement software helps the world's top content creators and distributors ensure fast, secure delivery of large files over public and private networks. Built on Signiant's patented technology, the company's on-premises software and SaaS solutions move petabytes of high-value data every day between users, applications and systems.

How Flight Works

- **ACCELERATED INPUT TO OBJECT STORAGE:** Flight is a high-speed bridge that moves files into the cloud in two pipeline stages. First of all, Signiant's **WAN acceleration technology** enables fast file movement from the storage on your network to the cloud platform. Once it's in the cloud, servers managed by Signiant write the data into object storage through a parallel multipart process over a low-latency local connection.
- **MANAGED CLOUD SERVERS AND SOFTWARE:** Flight delivers this technology in a unique way that takes full advantage of the cloud — it is the only accelerated onramp solution that eliminates the overhead of managing compute/VM resources in the cloud. Because Signiant manages the acceleration servers, there's no need to procure and deploy your own servers, install software, or configure and maintain the system in the cloud. The Flight SaaS solution does this all for you, complete with auto-scaling, redundancy, and load balancing.
- **SAAS DELIVERED:** Like Media Shuttle, Flight is delivered via Signiant's patent-pending hybrid SaaS platform. With this next-generation architecture, file transfer logistics, user interface delivery, and client updates are all managed by Signiant and delivered as a SaaS solution. This means that you will always have the latest software, you'll see a regular flow of innovative new features, and we will take the burden of ongoing software management off your shoulders. The powerful combination of this SaaS delivery and control layer, along with the managed server SaaS component, make Flight by far the most high performance, low maintenance way to get large files into the cloud, fast.
- **END-TO-END SECURITY:** Like all of Signiant's software, Flight was built with secure design principles in mind from the beginning. Flight's multiple layers of security and end-to-end encryption ensure that, even if one layer is breached, file content remains unreadable. Files are encrypted at rest, during transfer and retain a further layer of encryption while held in cloud storage, giving assets additional protection not provided by cloud storage vendors. With extensive 3rd party validation, Signiant Flight has the most secure file transfer protection available on the market.
- **GETTING STARTED:** Getting started with Flight is as easy as installing the client, entering your cloud storage account information, and transferring files. Your Flight subscription comes with 24/7 technical support, but we don't think you'll need it — the solution is designed for self-serve deployment and you will be up and running right away.

SYSTEM REQUIREMENTS

Cloud Storage

Amazon Web Services S3
Microsoft Azure

Clients

Hardware

Minimum of 8GB of Memory (RAM)

Command Line Interface

Windows 7 or higher
Windows Server 2012
Mac OSX 10.8 or higher
Red Hat Linux 6.x and above
CentOS Linux 6.x and above
Amazon Linux 6.x and above

Managers+Agents Component

Signiant Managers+Agents 9.x and above

For Mac OS X:

Safari 5+
Firefox 4+
Chrome 15+
